Football 2026 - Week 6 - Overall Top 15 (DX2J + MA'S MAN) (3:58 PM ET -- 3/14 final (CLE upset BAL 13-10). Live, most important first: NO 34-18 NYG (4th), CAR 19-14 PHI (4th), PIT 13-16 TB (4th), CH...

blue =differs from DX2J only, amber =MA'S MAN only, grey =both. Small # under a pick=its win odds. #=season rank, T=tied. Ovr=season W-L. Chalk Rate=share of real-favorite picks, recency-weighted. Win Prob%/Top 2%/Top 3% (gold/silver/bronze)=simulated odds of finishing the SEASON 1st, top 2, or top 3. Colored number rows above the picks=that game's importance for D and for M (1=most): add up every player who picked differently from that person on that game, each counted at a weight set by THEIR rank in this table at the start of the week (#15 counts 1 point, #1 counts 15), then rank all 14 games by that total. On the Projected table, *=not in the Actual Top 15.

Football 2026 - Week 6 - Overall Leaderboard (3:58 PM ET)

Every player in the pool, real season record/win rate/this week's upset-pick count (left) and projected record/win rate plus Dec%=Decisive-Weighted Chalk, the season model's actual input (right). "Proj" is the model's own expected-value final record. Ties never split at the cutoff on the left; the right is its own independent ranking (Season Winning Probability, whole pool), so a name's POSITION can differ a lot between the two. CHALK NORRIS (always picks the favorite) shows real record/rate stats on both sides but is excluded from the numbered ranking and 1st/Top 2/Top 3 odds (dash) -- a benchmark, not a real competitor.

How we're building toward season odds

Every week's sheet estimates **this week's** title odds via Monte Carlo. A **season-long** estimate needs a personal "**chalk rate**" (share of picks matching the real sportsbook favorite, recency-weighted) to simulate *likely* future picks.

Season Winning Probability (shown above) turns chalk rate into odds on a generic future game, Monte Carlo'd against everyone's real wins-so-far. Known gap: this only models weeks after this one.

SEASON PROGRESS 93 of 272 games played (34%) · 179 remaining

How We Figure Out Everyone's Odds

Football 2026 — Week 6 Picks Pool — written so anyone can follow it, no math background needed. Every number below is real and comes straight from this week's actual data.

1 Where the numbers come from

We don't guess, and we don't use a website's own computer prediction. We use the **real odds from DraftKings**, an actual sportsbook where real people bet real money on these games. If a game's odds are wrong, real bettors would be losing or winning money over it — that keeps the numbers honest.

2 Turning odds into a percentage

Sportsbooks show odds as a “moneyline” — a number like -225 or +185. A **minus** number means that team is expected to win (the bigger the number, the more likely). A **plus** number means they're the underdog.

The formula:

Favorite (minus number): chance = odds ÷ (odds + 100)
Underdog (plus number): chance = 100 ÷ (odds + 100)

Real example from this week — Washington @ San Francisco: SF is -425, so its raw chance is 425 ÷ (425 + 100) = **81.0%**. WAS is +330, so its raw chance is 100 ÷ (330 + 100) = **23.3%**.

Add those two up: 81.0% + 23.3% = **104.2%** — more than 100%! That extra bit is the sportsbook's own cut for running the bet (called the “vig”), and it's not a real chance of anything — we take it back out by dividing each number by the total:

SF = 81.0% ÷ 104.2% = 77.7% • WAS = 23.3% ÷ 104.2% = 22.3%

Now they add up to exactly 100% — that's the fair, honest percentage we actually use for that game.

3 Replaying the week 20,000 times

Think of it like hitting “restart” on a video game, over and over. Each time, the computer decides every undecided game — but not by flipping a fair coin. It rolls a **loaded die** weighted to match that game's real percentage from Step 2, so a 66% favorite really does win about 66 times out of every 100 pretend replays. Games that have already actually finished always come out the same real way — no re-rolling those.

After each pretend replay, the computer checks everyone's picks against that replay's results and writes down: who got the most correct? That's the “winner” of that one replay.

Your Win% is simply: out of all 20,000 pretend replays, in how many of them were you the winner (or tied for it)? If you won 1,200 of the 20,000 replays, your Win% is 1,200 ÷ 20,000 = 6%.

4 Breaking ties with the tiebreaker number

Sometimes two or more people are tied for the most correct picks in the same pretend replay. When that happens, whoever's tiebreaker number guess is **closest to that replay's combined score** of the Monday Night game (SF vs. WAS) wins that replay instead of splitting it.

Since that game hasn't been played yet, each replay also has to imagine a realistic final score for it. We use the sportsbook's own point spread (SF by 7.5) and total (51.5 combined points) to center a believable guess, then add a little random wobble — real NFL scores aren't perfectly predictable, so neither is our pretend one.

Exactly where this comes from, no hand-waving:

- **Odds:** DraftKings sportsbook lines, via ESPN's odds page, fetched fresh at the start of each week and updated as games are actually played.
- **The simulation:** a real computer program (Python), 20,000 random trials, run fresh every time this page updates — nothing here is picked by hand.
- **This snapshot:** 3:58 PM ET.
- **What it can't know:** injuries or news that happen after the odds were fetched, and it treats every game as independent (no weather affecting two games at once, etc.).

How We Score a Player's Picks

Football 2026 — Week 6 Picks Pool — written so a 12-year-old could follow it. This covers the three numbers on the Overall Leaderboard -- Chk%, Cnf%, Dec% -- and how the one we actually use gets turned into next week's odds.

1

Every game has a "favorite" before it's even played

Real sportsbooks set odds on every NFL game before kickoff -- which team is more likely to win, and by how much. We already use these real odds to turn a moneyline into a percentage (see “How The Odds Work” elsewhere in this PDF). This page is about a different question: once we know who was favored and by how much, how do we turn a WHOLE SEASON of someone's picks into one fair score?

2

Try #1: Chalk Rate (too simple on its own)

The simplest idea: just count how often someone picked the favorite. Pick the favorite in a game, +1. Pick the underdog, +0. Add it all up and divide by how many games they've picked. That's **Chalk Rate** (the “Chk%” column).

The problem: this can't tell the difference between a game where the favorite was a sure thing (say, 85% likely to win) and a game that was basically a coin flip (51% likely). Both count as a full point if you pick the favorite. That makes some players look safer than they really are.

3

Try #2: Pick Confidence (fixes that, but a little too much)

Next idea: instead of counting match/no-match, just average the REAL percentage of whichever team someone picked. Pick an 85% favorite, that's worth 0.85. Pick a 38% underdog, that's worth 0.38. This is **Pick Confidence** (“Cnf%”).

This fixes the first problem -- a big upset pick really does hurt your number more than a small one. But it creates a new one: a 51%-favorite pick and a 49%-underdog pick end up almost identical (0.51 vs 0.49), even though one of them is the safe, obvious choice and the other is a real coin-flip gamble.

4

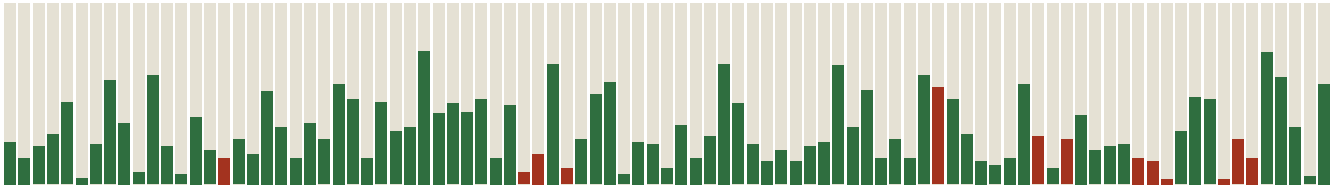

What we actually use: Decisive-Weighted Chalk Rate

The fix: go back to the simple match/no-match idea from Chalk Rate (so picking a real favorite still gets full credit, not a discount) -- but let each game's VOTE count more or less depending on how lopsided it really was. A coin-flip game barely counts at all, whichever side you picked. A real blowout game -- getting it right OR wrong -- counts a lot. This is **Decisive-Weighted Chalk Rate** (“Dec%”), and it's the one that actually drives the season projection.

Think of it like a classroom vote where everyone's opinion counts, but a student who feels VERY strongly gets a louder voice than a student who's just barely leaning one way. The lopsided games are the strong opinions. The coin-flip games barely whisper.

A real example: LAKER QUAKER's whole season so far

Every pick LAKER QUAKER has made this season, one bar per game, in order. Tall bar = that game was lopsided (one team was clearly better). Short bar = that game was close to a coin flip. Green = picked the favorite. Red = picked the upset.

■ tall + green = a confident, correct call ■ tall + red = a real, bold upset pick anyway short bars (either color) = barely matter -- that game was a toss-up

Chalk Rate (Chk%)	Pick Confidence (Cnf%)	Decisive-Weighted (Dec%)
81%	62%	89%

Notice LAKER QUAKER's Chalk Rate (81%) is high -- they almost always side with the favorite. But a lot of those “safe” picks were short bars above -- close games that were barely different from a coin flip. Pick Confidence (62%) drops a lot, since it treats ALL those close games as worth barely more than 50%, win or lose. Decisive-Weighted Chalk (89%) ends up high again, closer to Chalk Rate -- because this player's real upsets happened to land on lopsided games too, so down-weighting the coin-flip games mostly just removes noise, not real signal.

5

Turning that one number into real odds

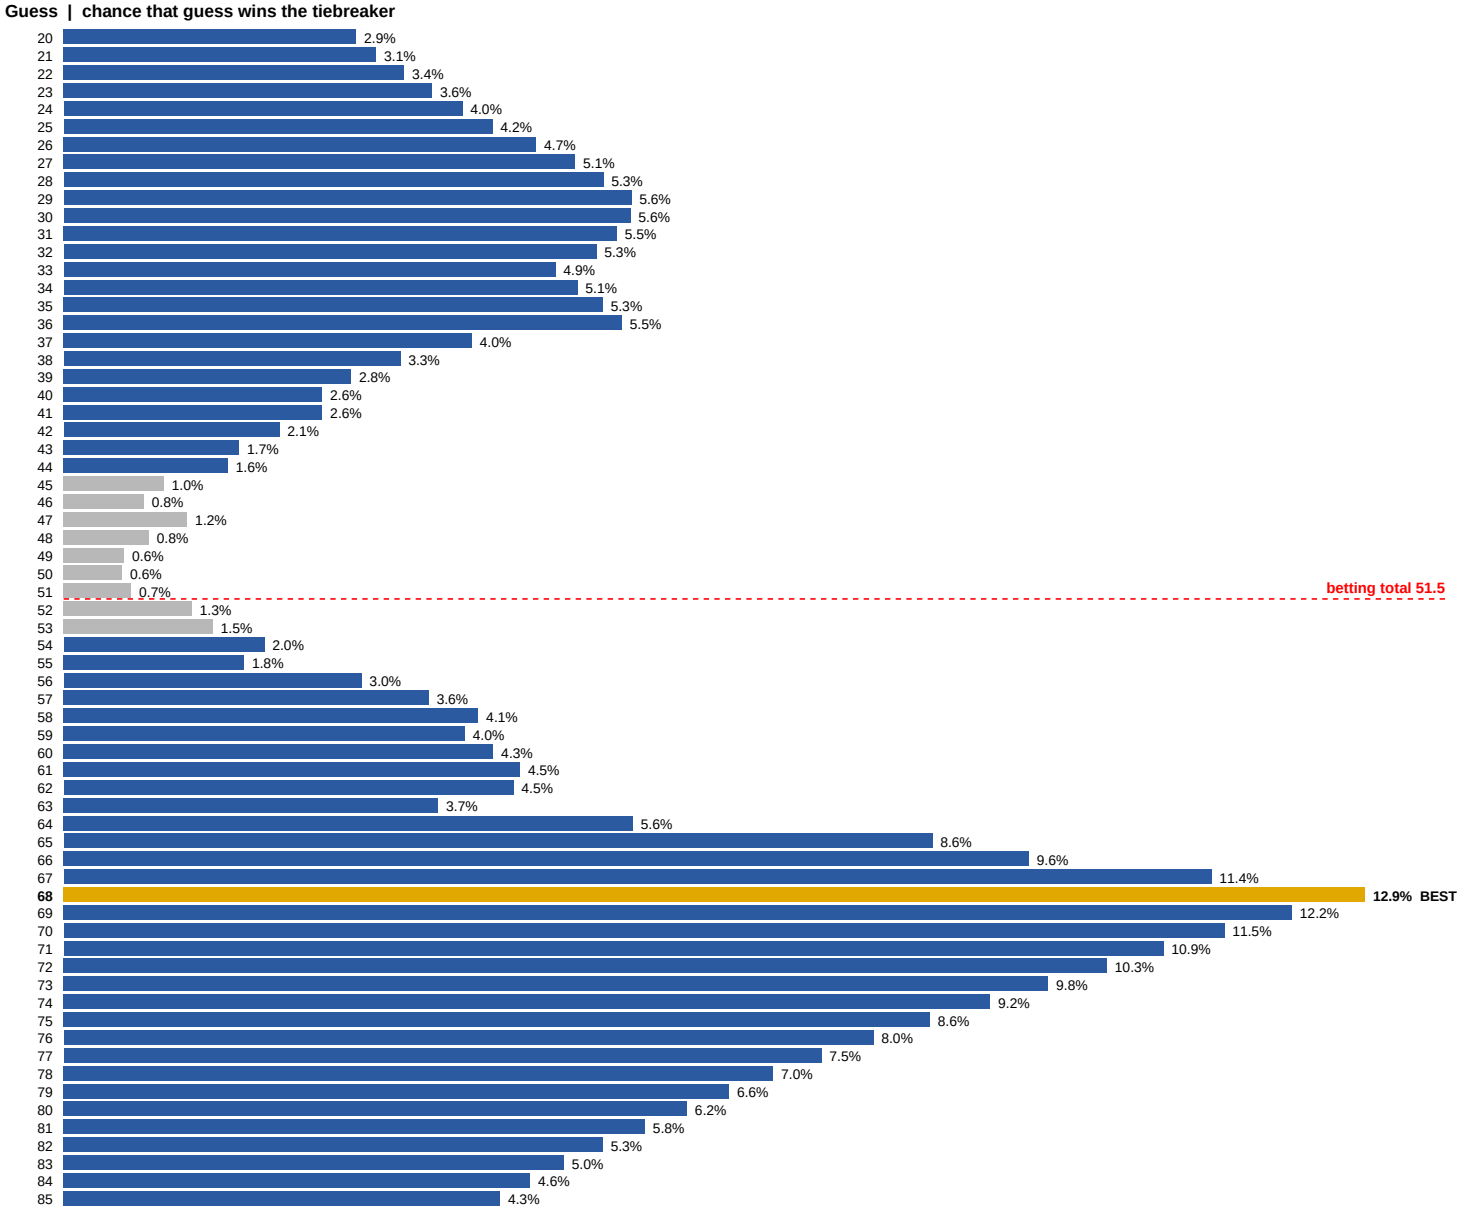

A Decisive-Weighted Chalk Rate by itself isn't a win probability yet -- it's just “how often does this player side with the favorite, on games that actually matter.” To turn that into “how likely are they to win a FUTURE game,” we mix it with one more real number: how often favorites have actually won games THIS season so far (63% of the time, so far this season).

The formula: **win chance = (their rate × 63%) + ((1 − their rate) × 37%)**. In plain words: if someone always sides with the favorite, their future win chance is close to how often favorites actually win. If someone often sides AGAINST the favorite, their future win chance flips toward how often UNDERDOGS win instead.

From there, the rest of the season model is the same Monte Carlo simulation described in “How The Odds Work” -- just with a more honest starting number feeding into it.

Football 2026 - Week 6 Tiebreaker Guess Chart

Monday night: Washington at San Francisco | DraftKings total 51.5 | 55-person pool | gold = best guess, grey = dead zone (under 1.5%)

How to read it

Best guess: 68 (12.9% chance to win the tiebreaker). Best low-side guess: 29 (5.6%). **Dead zone: 45-53** -- that's where this pool piles up, so even when the game lands there someone else is usually as close or closer. The high side pays best because almost nobody in this pool guesses high, so one guess there owns every high-scoring finish by itself. The tiebreaker only matters if you finish tied on wins, and gaps of a point or two between neighboring numbers are within simulation noise.

How this chart was created

1. The game. The Monday-night combined score is simulated 30,000 times as a bell curve centered on the DraftKings over/under (51.5) with a spread of 14.1 points -- the same scoring assumption the pool's season-odds model already uses (10 points of uncertainty per team). About two-thirds of simulated games land within 14 points of the line.

2. The other 54 guesses. Built from this pool's real tiebreaker guesses (280 guesses across Week 1, Week 2, Week 3, Week 4, Week 5). Each past guess is stored as its distance from that week's line, then re-applied to this week's line -- so the chart carries over this pool's actual habits. On average the pool guesses 2.6 points under the line, and very few guesses go far above it.

3. Scoring. In each simulated game, every guess from 20 to 85 is checked against the simulated crowd: a guess that is strictly closest to the final combined score wins outright; a tie for closest splits the win (half credit for a 2-way tie, and so on). The bar is the share of all simulated games that guess would win.

Limits. It assumes this week's crowd guesses like past weeks' crowds did, and that the betting total is an unbiased center for the final score. If many players read this chart and move to the same number, that number stops being an edge.
